Mai 2003 (23.05.2003) DE (57) Abstract: The invention relates to a blood-treating device provided with a blood-treating unit in the form of the part of an extracorporeal blood circuit. The inventive device comprises a control unit (30) a display and input unit (32) provided with a touch screen (33). In order to simplify the use of said blood treating device by means of the touch screen, the control unit (30) and the display and input unit (32) are embodied in such a way that it is possible to display different elements of corresponding modes with different temporal modes on the touch screen. According to said invention, the control unit automatically generates the beginning of a following temporal mode at the end of at least one temporal mode, thereby changing the display of the elements of a selected mode on the touch screen. The use of sensors (9, 12) is particularly recommended since the measured values thereof enable control unit (30) to recognise the end of a temporal mode and the beginning of a following temporal mode.
